

INTRODUCING

Cleveland Menu is excited to announce our new Ultra-Fresh® antimicrobial treatment to our exclusive Durapoly synthetic menus, **available at no additional cost.**

The UV coating is treated with Ultra-Fresh®, an innovative antimicrobial technology designed to create a cleaner menu surface. Ultra-Fresh® provides a cleaner menu surface through the use of silver ions to prevent bacterial proliferation on the surfaces of your menus, with long-term protection.

Ultra-Fresh additive greatly reduces the growth of bacteria on the surfaces it is treated with. It is an excellent option to keep your menus cleaner and fresher longer.

In keeping with CDC recommendations against preventing spread of disease by regular cleaning and sanitizing "touch" surfaces we encourage the same with your menus.

While there is currently no product that can continuously destroy COVID-19 virus on surfaces, diligent cleaning will prevent food and spills from building up on the menu surface.

To prevent premature wear of the menus we recommend use of alcohol based general disinfectants approved for restaurant use. Please be sure to follow directions and to dry thoroughly.

As always please feel free to contact us if you have any questions regarding Ultra-Fresh or our other menu products.

Thank you,
